Email Security in the Cloud made Simple

All Lines Technology can help you bring email security to your organization without making it too complicated for all your users. Companies have users in so many different roles, on the road, in the office, or at a customer location. Wherever your user is the need to stay connected and not being on the company's network can leave your user vulnerable.

Using Microsoft security products we can set up:
Password Policy | MFA | Enable Country Blocking | Account lockout after three failures | BaaS Cloud based backup as a service | Educate users on phishing schemes | Encryption on Email (SECURE in the subject line) | Banner on emails from outside your domain
